## COMP9414: Artificial Intelligence Solutions 3: Constraint Satisfaction/Planning

1. Let  $Q_i$  be variables whose domain is  $\{1, \dots, 8\}$ . The value assigned to  $Q_i$  is the row of the Queen in column i.

Backtracking search starts by assigning 1 to  $Q_1$  (assuming variables and values are chosen in order). Forward checking removes 1 and i from the domains of each other  $Q_i$ . Then  $Q_2$  is assigned 3, and forward checking removes 3 from the domains of  $Q_3, \dots, Q_8, 2$  and 4 from  $Q_3, 5$  from  $Q_4, 6$  from  $Q_5, 7$  from  $Q_6$  and 8 from  $Q_7$ . Then  $Q_3$  is assigned 5, etc.

Domain splitting is similar. At the first step, the domain of  $Q_1$  is split into  $\{1, 2, 3, 4\}$  and  $\{5, 6, 7, 8\}$ . These are both arc consistent. The first domain is split again into  $\{1, 2\}$  and  $\{3, 4\}$ . Again these subproblems are arc consistent. The first domain is split again, into  $\{1\}$  and  $\{2\}$ , and now arc consistency proceeds much as forward checking. However, this depends on the order of variable and problem selection.

- 2. stack(A, B): precond clear(A), clear(B); add list on(A, B); delete list clear(B) unstack(A): precond clear(A), on(A, B); add list on(A, Table), clear(B); delete list on(A, B)
- 3. The nonlinear planner introduces the two actions stack(B,C) and stack(A,B). The clear(A) precondition of stack(A,B) does not hold in the initial state, so unstack(C) is added to the plan. Because stack(A,B) deletes clear(B), which is a precondition of stack(B,C), stack(B,C) must be before stack(A,B). For the same reason, unstack(C) must be before stack(B,C). The plan is therefore unstack(C), stack(B,C), stack(A,B).
